● IOT PROJECT · ARDUINO UNO Q + ESP32 CYD

UCIS

A cricket scoreboard box that runs entirely on one Arduino. No PC, no cloud server.

● SCREEN 1 · LIVE

333/10

NZ v IND · ODI · 50.0 ov
Live from the CricketData API

SCREEN 2 · **SIM**

Your teams, your batting order, simulated ball by ball

HOW THE SCORE TRAVELS

01 · DATA
CricketData API
Live scores, polled every 2½ min to stay inside 100 free calls a day.

02 · BRAIN
UNO Q hub
Python hub in Docker on the board's Linux side. Stores matches, runs the simulator.

03 · LINK
UART wire
UNO Q MCU relays JSON to the screen at 115200 baud over 3 wires.

04 · SCREEN
CYD display
ESP32 2.8” touch screen. Tap to switch screens, hold for the QR code.

RUN IT FROM A PHONE

The UNO Q hosts its own WiFi, **UCIS-Cricket**. Open the dashboard to pick the screen, set up a simulation with two teams, their batting order and bowlers, then pause, resume or speed it up. Brightness, rotation and the QR code are controlled from there too.

CSK · DC · GT · KKR · LSG · MI · PBKS · RR · RCB · SRH

WHAT COMES NEXT

Simulator and what-if engine in Rust	speed
Player rating cards from IPL ball-by-ball data	Cricsheet
What-if replays of real matches	replay
Crowd prediction game on a /play page	game
LED matrix flashes on a 4, a 6 or a wicket	UNO Q MCU
Android app	Tauri 2
Wireless link between the screen and the box	last

Join UCIS-Cricket, then scan to open the dashboard.
